

Showing Elevation profile, to the left of the graph, several positions have been provide with an initial altitude of 4545ft. You can use successive measurements or an average. In the example above, successive measurements determine that the launch site is 4,545 MSL; ground level is 4,545 MSL.

Find the maximum airborne altitude of 17,121 MSL. Subtract: $17,121 - 4,545 = 12,576'$ AGL.
